

SWING_PRO Trading Hub

v2.2 · rebuilt July 02, 2026 · validated on 2 years of full-market data · parity-verified against TradingView (largest win matched within \$1) · forward test LIVE on Alpaca paper. Educational use only — not financial advice.

THE SYSTEM — SWING_PRO v2.2

One strategy, one script, every choice earned by out-of-sample evidence: **long-only** momentum-confluence entries on **5-minute** charts — seven gates (75-min trend slope, MACD, Impulse, RSI band, ADX, SPY alignment, green entry bar) must all agree — then **pure risk management**: structure stop under the recent swing, 3R profit target, nothing else. No partials, no breakeven creep, no early exits: testing proved every 'protective' mechanism was taxing the big winners that pay for everything. **Its honest personality: ~37% of trades win — the wins are ~3x the losses. Patience is the strategy.**

Profit factor, 2-yr backtest	1.30 (\$1.30 made per \$1 lost)
Trade frequency	~4.2 per week per 5-symbol basket
Max drawdown, 2 yrs, flat 10% sizing	-2.2% (highly capital-efficient)
Judgment rule	no verdict before 30 closed forward trades (4-6 weeks)

LIVE RIGHT NOW — THE AUTONOMOUS MACHINE (6 tasks, all wake the PC)

Forward trader	every minute, 6:25-1:20	Paper-trades v2.2 on Alpaca (\$100k, simulated): 5m decisions, 1m-resolution exits. Hardened: state reconciles against the real account every tick.
Flow capture	6:28-1:02, streaming	Live CVD / book imbalance / block prints, all 10 symbols, one row per minute -> building the intraday order-flow dataset money can't buy at \$0.
Options snapshot	daily 12:45	Put/call OI + volume ratios, GEX proxy, ATM IV per ticker -> per-ticker options history, testable ~mid-August.
Daily report	daily 1:20	Refreshes reports/forward_test.md (equity, positions, events).
Friday referee	Fridays 1:30	The report card: real fills vs benchmarks, realized slippage vs the \$0.01 assumption, per-basket scores, variance context baked in.
Silent launcher	always	All tasks run windowless (no more cmd pop-ups).

THE TWO-BASKET DUEL (settled by reality, not backtests)

Current	AAPL NVDA TSLA MSFT META	1.30	the original Big Tech five
Candidate	MSTR ORCL NFLX AVGO CRWD	1.40	universe-scan winner (50 symbols ranked); MSTR flagged as the likely landmine - watch it fail on purpose
Bench (v3 seeds)	ARM MU WMT PLTR KLAC INTC	-	consistent in BOTH data halves; candidates for the next basket if the duel validates the method

THE EVIDENCE LEDGER

Two days, ~14 pre-registered experiments, 2 years of 5m/1m full-market data, one discipline: derive on the first year, validate untouched on the second, adopt only what wins BOTH. The graveyard is the point — every rejection below is why the survivor deserves trust.

SURVIVED VALIDATION (in the live system)

Pure stop + 3R target exits	PF 1.08 -> 1.30; consistent in both halves (exit sweep, 64 configs)
Long-only	shorts lost ~\$10.8k/2yr, PF 0.65, in EVERY configuration tested
1m-resolution execution (variant B)	best config of the MTF test: PF 1.10, 4/5 symbols, +\$2.3k vs 5m fills
Slope, SPY-alignment + candle filters	removing any one cost \$500-\$1,800 (ablation)
Flat 10% sizing	beat equal-risk, caps and day-stops on MAR across 18 rules
Engine parity	Python harness matches TradingView trade-for-trade (largest win within \$1)

TESTED AND BURIED (do not resurrect without new data)

Volume gate, price-vs-trend gate	dead weight: halved trades / changed nothing (ablation)
MACD-flip, trend-line, partial + breakeven exits	each one clipped the 3R winners that carry the system
1m-trigger entries (tight 1m stops)	0/5 symbols profitable, 1,513 trades - noise + 3x cost drag
Extension veto / anti-chase	the 'chasing' entries ARE the profitable ones - it's a momentum system
Pullback-only entries, loss cooldowns	worse or no effect on both sides
1-hour timeframe port	PF 1.52 was all year-one; year two lost money (regime mirage)
Regime gates (50-day SMA etc.)	SIGN-FLIPPED out of sample: blocked the best trades of year two
Daily dark-pool / gamma data (DIX, GEX, FINRA)	direction held but ~1-sigma - not tradable at daily granularity
Limit entries, time-stops	97% fill rate means savings = missed winners; a wash both ways
Equal-risk sizing, position caps, daily loss stop	more return only via more risk; worse per unit of pain

PANIC THRESHOLDS (Monte Carlo, 10,000 shuffles - read before any losing week)

Losing streak	up to 12 in a row
Worst 6-week stretch	down to -\$1,030
Chance a healthy system still loses a 6-week window	17.5% - one in six report cards looks bad and means nothing

Toolkit + Roadmap

TRADINGVIEW KIT (paste from Swing-Pro-Trading/)

SWING_PRO_v2.pine (v2.2)	THE strategy: signals + alerts + live stop/target lines + plain-English dashboard with an honest verdict row. Premium? set use_bar_magnifier=true (= validated 1m fills).
SWING_PRO_XRAY.pine	Idea engine: 7 gate heat-rows, 0-7 confluence score, near-miss diamonds (6/7), live 'why no trade' table naming the exact blocker. Mine the diamonds for hypotheses.
OrderFlow_Proxy.pine (rev 2)	CVD / divergences / blocks / absorption pane. Fixed: plan-safe minute intrabars (the old seconds request crashed on non-Premium). Wires into v2.2 group 7.

Watchlist: AAPL, NVDA, TSLA, MSFT, META, MSTR, ORCL, NFLX, AVGO, CRWD, ARM, MU, WMT, PLTR, KLAC, INTC

PYTHON HARNESS (Swing-Pro-Trading/backtest/)

swing_pro.py / indicators.py / mtf_engine.py	the Pine-exact engine (parity-verified) + all indicator math
data.py / free_data.py	Alpaca SIP loader (2yr 5m + 1m cached) - DIX/GEX + FINRA short-volume
forward_trader.py / forward_review.py	the live paper trader + the Friday referee
capture_flow.py / options_snapshot.py	the two dataset accumulators
run_*.py (ablation, walkforward, exit sweep, universe scan, risk layer, montecarlo...)	every experiment, rerunnable; all reports in backtest/reports/

THE PLAN IN PLAIN ENGLISH

1. Rehearse against history - keep only what survives honest validation	DONE (v2.2 is what survived)
2. Audition with live prices, fake money - 4-6 weeks on the Alpaca paper account, graded every Friday vs PF 1.30	RUNNING - started July 2, 2026
3. Real money conversation - only if step 2 passes, only small	LOCKED until step 2 verdict

NEXT MILESTONES

Every Friday 1:30 PM	one-page report card: read it, resist judging before 30 closed trades
~Mid-August 2026	options dataset mature -> test per-ticker P/C + GEX gates against REAL forward trades (fresh data, not the retired well)
Flow dataset mature	test CVD-confirmation entries the honest way
Next build (agreed)	Strategy #2: a mean-reversion system, anti-correlated with v2.2 - the portfolio answer to a thin single edge

House rules: the 2-yr H1/H2 dataset is RETIRED (~14 tests is its limit - further mining manufactures confidence, not edge). Chart eyes generate hypotheses; only the harness convicts or acquits. Nothing trades real money until reality itself has voted. Not financial advice.
