THE PITCH — SWING_PRO

A confluence filter, not a fortune-teller. SWING_PRO waits for trend, momentum and context to independently agree, then acts — and records every result as a real, backtestable strategy().

! The problem

- Timeframe mismatch pins signals to one side
- One-sided in trends — the signals you need never fire
- Pretty arrows, zero proof (no win rate / P&L)
- Chasing & over-trading climax bars

✓ The solution

State-based entries (no exact-cross timing), a non-repainting higher-timeframe trend, volatility-aware filters, and an explicit exit engine — all built as a strategy() so every decision is measurable.

6 How it decides

- Adaptive HTF trend (scales to your chart)
- Slope, not just sign — must move min ATRs
- MACD + Impulse must agree
- RSI neutral band — no coin-flips
- ADX · Volume · Session gates
- Anti-chase guards + enforced spacing

3 Entry styles

- **Trend** — everything lines up (core, highest conviction)
- **Pullback** — buy the dip / sell the bounce in a trend
- **Reversal** — counter-trend turn (riskiest, off by default)

\$ The risk engine

- Structure stop just past the recent swing
- Bank 50% partial at +1R

▲ Prove it

- Backtest a baseline on your symbol & timeframe
- A/B each entry type and filter to isolate edge

- Stop → breakeven once in profit

- Walk-forward on out-of-sample windows
- Forward-test on paper before real risk

HOW THE PIECES FIT TOGETHER

Three layers of order-flow, fast to slow, all pointed at the same AAPL setups.

FAST TIMING · REAL-TIME · FREE **alpaca_stream.py**

Live CVD, top-of-book imbalance and block alerts off Alpaca's IEX websocket. Is flow confirming a BUY *right now*?

SLOW CONTEXT · DELAYED · CHEAP **darkpool_orderbook.py**

Off-exchange (dark-pool) ratio, venue breakdown and block prints from Polygon. Is institutional flow accumulating or distributing today?

ON-CHART VISUAL **OrderFlow_Proxy.pine**

The same CVD / divergence / block ideas drawn on your TradingView chart for visual confluence with the signals.

CORE SIGNALS **Swing1m_PRO · _strategy**

The indicator plots live BUY/SELL/exit; the strategy runs identical logic through the Strategy Tester for win-rate and P&L.

Honest disclosure (from the deck): Not financial advice — a research & testing tool, not a recommendation. Backtests are hypotheses to falsify, never a promise. With ~50 inputs, curve-fit risk is real — validate out-of-sample and forward-test on paper before any real money.
